LOCAL-FIRST APPLICATION ARCHITECTURE

Privacy Policy

Effective Date: October 17, 2026
Last Updated: October 17, 2026
Version: 0.9 (Pre-Release Build)
Data Model: Local Encrypted (AES-256)

DEVELOPMENT NOTICE & LIMITATION OF LIABILITY

This application is currently in active development and is not yet intended for mainstream public distribution. While we have implemented industry-standard security measures and best practices to prevent unauthorized access or data breaches—including local-first storage, input sanitization, and SQLCipher/AES-256 encryption—**we are not responsible or liable for any loss, breach, corruption, or unauthorized access to your data.** By using this software during its pre-release testing phase, you acknowledge that you accept full responsibility for managing and backing up your local device state.

1. Information We Collect & Process Locally

Our application processes physical biometrics, mental well-being inputs, and device health data exclusively on your local hardware device to establish personalized energy profiles and calculate cognitive fatigue indices:

- **Biometric & Profile Data:** Age, gender, height, current weight, target weight, and baseline physical activity level.
- **Health & Fitness Metrics:** Data imported from platform health APIs (e.g., Apple HealthKit, Android Health Connect, Google Fit) including step count, active calories burned, sleep metrics, and heart rate variability (HRV).
- **Nutrition & Calorie Logs:** Food intake logs, meal timing, and calorie/macronutrient tracking records.
- **Energy & Mental Health Journaling Data:** User-inputted mood scores, energy levels, end-of-day reflection entries, and conversational responses.
- **AI Profile & Behavioral Logs:** On-device computational profiles generated to analyze burnout risk, Cognitive Fatigue Index (CFI), and nutrient depletion triggers.

2. On-Device Architecture & Security Safeguards

To protect sensitive physical and mental health records, our system relies on strict local-first privacy safeguards:

- **Local AI Processing:** All Artificial Intelligence computations, conversational feedback engines, and fatigue prediction models run entirely on your local device hardware. No prompt data, personal notes, or journal entries are transmitted to cloud servers for AI training or inference.
- **Input Sanitization:** All user inputs pass through a local input sanitization layer to strip personally identifiable information (PII) before database storage or local model ingestion.
- **On-Device Encryption:** Your user profile, health records, and AI memory embeddings are stored locally using AES-256 / SQLCipher database encryption at rest.

3. Purpose & Functional Use of Data

Your data is processed strictly on your local device for the following core functionalities:

- Calculating body metrics including BMI, Basal Metabolic Rate (BMR), and Total Daily Energy Expenditure (TDEE).
- Generating dynamic calorie intake targets and providing real-time depletion/hypoglycemia alerts before intense shifts or workouts.
- Calculating the Cognitive Fatigue Index (CFI) to trigger protective active interventions (e.g., schedule defragmentation, physiological sigh alerts, forced rest buffers) when cognitive load exceeds critical thresholds (e.g., >80%).
- Providing tailored goal settings, milestone achievements, and end-of-day reflective journal summaries.

4. Health Data Synchronization & Permissions

When connecting the app to platform health providers (such as Apple Health, Google Fit, or Android Health Connect), explicit permission is requested to access specific metric data:

- **No Cloud Transmission:** Integrated health data is read locally by the app and used exclusively within the application's local algorithms.
- **No Selling or Data Brokerage:** We do not sell, license, share, or transfer your health, biometric, or behavioral data to third-party advertisers, data brokers, or external cloud entities.

5. Data Retention & User Control

- **Data Ownership:** You maintain complete ownership of all data generated within or imported into the application.
- **Data Erasure:** Because your data is stored locally in an encrypted database, uninstalling the application or selecting "Reset App Data" inside settings permanently deletes all encrypted databases and local AI profile histories.

6. Policy Updates & Contact

We may update this Privacy Policy to reflect changes in local data handling protocols or legal requirements. Any modifications will be posted directly within the app's settings section.

Questions or Support: If you have questions regarding this Privacy Policy or local data protection practices during the testing phase, please reach out through the application settings menu.
